Introduction to Organic Chemistry

Organic Chemistry I as a Second Language

Instruction and assessment are so common to teaching and learning that for many readers this may be second nature. There are certainly many kinds of instruction and assessment available to instructors, and these are chosen based on many factors. Thinking beyond standard content tests, considering other, innovative assessments, we may enjoy a richer picture of what students know or understand by investigating prior knowledge, misconceptions, motivations, or self-concept. The book is organized into four general sections: the first section describes the processes by which assessments are constructed and used. The second section focuses on what is learned from assessments in an informal environment, including the use of practice exams and feedback provided to help students reflect on their own learning. Formal classroom assessments and the decisions associated with different assessments and techniques comprises the third section. The final section focuses on assessment goals and innovative investigations of student learning with descriptions of new assessments and new online tools for measuring student understanding.

This guide is separated into first-term and second-term general chemistry material. Each section contains 8 chapters of material that also aligns to most general chemistry textbooks for a seamless addition to study materials for students. Each chapter is designed with an introductory section of the material including common representations and where to find this material in a textbook. The second section provides worked examples of typical, multiple choice questions including how the correct answer is determined as well as how the incorrect answers were determined. Also included for each study problem is a listing of the corresponding practice questions that use that concept. The final section is a series of practice problems to test the concepts collectively. The key is provided on a separate page for all study and practice problems.

Although the difficulties many students encounter when learning chemistry have been known and explored for decades, there is no consensus on how best to assist and assess their learning. Over the past ten years, the availability of a range of technological innovations that are intended to improve student learning and assessment has made the choice of teaching and assessment strategies more complex. Many teachers are rapidly adopting new technologies in teaching and assessment although their impacts have not yet been extensively studied. Many researchers have investigated the use of specific technologies in aspects of their teaching and assessment, and this book contributes to a growing body of literature that allows some generalizations to be drawn. Most importantly, specific strategies are described in detail making it possible for others to take advantage of the learning experiences and allowing practitioners to adopt the practice best suited to their needs. General tools for chemistry education range from tailored websites (including Web 2.0 interactive features), to optimizing the use of flipped classrooms, to the application of commercial packages in a coherent manner. The book focuses on these aspects of using technology directly in teaching chemistry. One area of great interest in chemistry education is the role of the teaching laboratory and how best to optimize laboratory learning. The use of short videos, animations, and best assessment practices are also covered. The chapters in the book reflect the somewhat different teaching contexts of the countries in which the authors work.
